

Test Question 5(24.7.24)

SET 1

1. Develop a simple banking system that allows users to create accounts, deposit money, withdraw money, and check balance. Implement methods for account creation, deposit, withdrawal, and balance inquiry.

Methods:

- createAccount(String accountHolderName, double initialDeposit)
- depositMoney(String accountNumber, double amount)
- withdrawMoney(String accountNumber, double amount)
- checkBalance(String accountNumber)

code:

```
import java.util.HashMap;
```

```
import java.util.Map;
```

```
class Account {
```

```
    private String accountNumber;
```

```
    private String accountHolderName;
```

```
    private double balance;
```

```
    public Account(String accountNumber, String accountHolderName, double  
initialDeposit) {
```

```
        this.accountNumber = accountNumber;
```

```
        this.accountHolderName = accountHolderName;

        this.balance = initialDeposit;

    }
}
```

```
public String getAccountNumber() {

    return accountNumber;

}
```

```
public String getAccountHolderName() {

    return accountHolderName;

}
```

```
public double getBalance() {

    return balance;

}
```

```
public void deposit(double amount) {

    balance += amount;

}
```

```
public void withdraw(double amount) {  
  
    if (balance >= amount) {  
  
        balance -= amount;  
  
    } else {  
  
        System.out.println("insufficient balance");  
  
    }  
  
}  
  
}
```

```
public class Bank {  
  
    private Map<String, Account> accounts;  
  
    private int accountCount;  
  
    public Bank() {  
  
        accounts = new HashMap<>();  
  
        accountCount = 0;  
  
    }
```

```
public String createAccount(String accountHolderName, double initialDeposit) {  
  
    accountCount++;  
  
    String accountNumber = "rest" + accountCount;  
  
    Account account = new Account(accountNumber, accountHolderName,  
initialDeposit);  
  
    accounts.put(accountNumber, account);  
  
    return accountNumber;  
  
}
```

```
public void depositMoney(String accountNumber, double amount) {  
  
    if (accounts.containsKey(accountNumber)) {  
  
        accounts.get(accountNumber).deposit(amount);  
  
        System.out.println("deposit successful");  
  
    } else {  
  
        System.out.println("account not found");  
  
    }  
  
}
```

```
public void withdrawMoney(String accountNumber, double amount) {
```

```
        if (accounts.containsKey(accountNumber)) {

            accounts.get(accountNumber).withdraw(amount);

            System.out.println("withdrawal successful");

        } else {

            System.out.println("account not found");

        }

    }

}

public void checkBalance(String accountNumber) {

    if (accounts.containsKey(accountNumber)) {

        double balance = accounts.get(accountNumber).getBalance();

        System.out.println("your balance : " + balance);

    } else {

        System.out.println("account not found");

    }

}

}

public static void main(String[] args) {

    Bank bank = new Bank();
```

```
String accountNumber = bank.createAccount("John Doe", 1000);

System.out.println("account created : " + accountNumber);

bank.depositMoney(accountNumber, 7890);

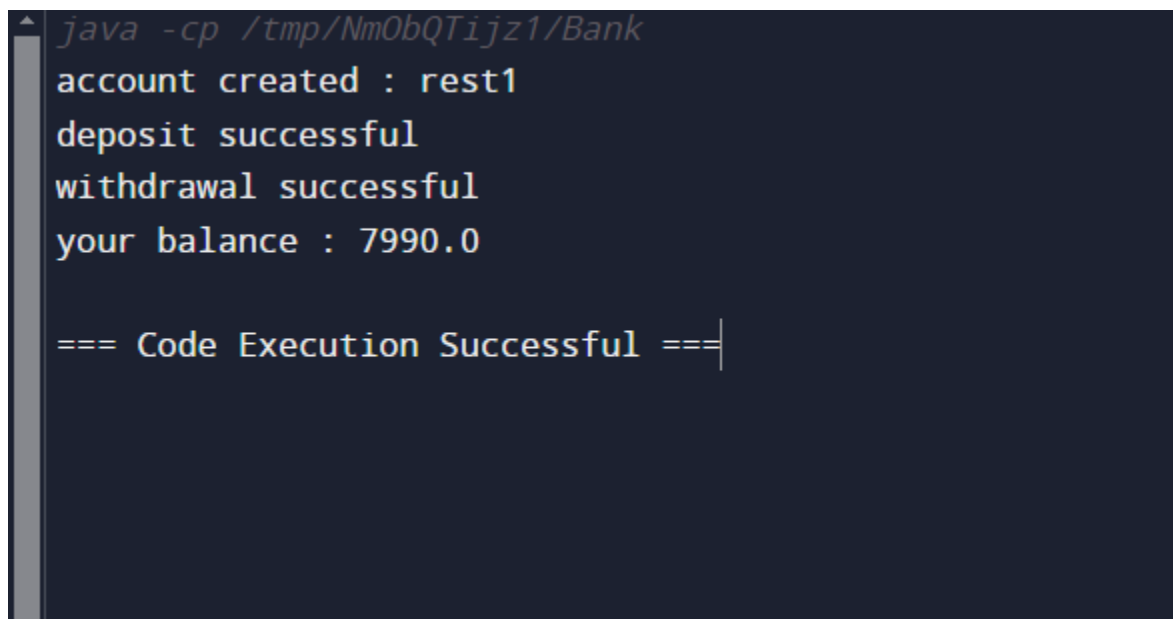

bank.withdrawMoney(accountNumber, 900);

bank.checkBalance(accountNumber);

}

}
```

Output:

A screenshot of a terminal window with a dark background. The command 'java -cp /tmp/NmObQTijz1/Bank' is entered at the top. Below it, the program's output is displayed: 'account created : rest1', 'deposit successful', 'withdrawal successful', and 'your balance : 7990.0'. At the bottom, a separator line reads '=== Code Execution Successful ===' followed by a cursor.

```
^ java -cp /tmp/NmObQTijz1/Bank
account created : rest1
deposit successful
withdrawal successful
your balance : 7990.0

=== Code Execution Successful ===|
```

2. Create an expense tracker that allows users to add expenses, categorize them, and view a summary report. Implement methods to add expenses, categorize expenses, and generate reports.

Methods:

- addExpense(String description, double amount, String category)

- viewExpensesByCategory(String category)
- generateExpenseReport()

code:

```
import java.util.*;
```

```
class Expense {
```

```
    private String description;
```

```
    private double amount;
```

```
    private String category;
```

```
    public Expense(String description, double amount, String category) {
```

```
        this.description = description;
```

```
        this.amount = amount;
```

```
        this.category = category;
```

```
    }
```

```
    public String getDescription() {
```

```
        return description;
```

```
    }
```

```
public double getAmount() {  
  
    return amount;  
  
}
```

```
public String getCategory() {  
  
    return category;  
  
}  
  
}
```

```
public class ExpenseTracker {  
  
    private Map<String, List<Expense>> expenses;  
  
    public ExpenseTracker() {  
  
        expenses = new HashMap<>();  
  
    }
```

```
public void addExpense(String description, double amount, String category) {  
  
    Expense expense = new Expense(description, amount, category);
```

```
    if (expenses.containsKey(category)) {  
  
        expenses.get(category).add(expense);  
  
    } else {  
  
        List<Expense> list = new ArrayList<>();  
  
        list.add(expense);  
  
        expenses.put(category, list);  
  
    }  
  
}
```

```
public void viewExpensesByCategory(String category) {  
  
    if (expenses.containsKey(category)) {  
  
        List<Expense> list = expenses.get(category);  
  
        System.out.println("Expenses in category: " + category);  
  
        for (Expense expense : list) {  
  
            System.out.println("Description: " + expense.getDescription() + ", Amount: " +  
expense.getAmount());  
  
        }  
  
    } else {  
  
        System.out.println("No expenses in category: " + category);  
  
    }  
  
}
```

```
}  
  
}
```

```
public void generateExpenseReport() {  
  
    double total = 0;  
  
    for (Map.Entry<String, List<Expense>> entry : expenses.entrySet()) {  
  
        double categoryTotal = 0;  
  
        System.out.println("Category: " + entry.getKey());  
  
        for (Expense expense : entry.getValue()) {  
  
            System.out.println("Description: " + expense.getDescription() + ", Amount: " +  
expense.getAmount());  
  
            categoryTotal += expense.getAmount();  
  
        }  
  
        System.out.println("Total for category: " + categoryTotal);  
  
        System.out.println();  
  
        total += categoryTotal;  
  
    }  
  
    System.out.println("Total expenses: " + total);  
  
}
```

```
public static void main(String[] args) {  
  
    ExpenseTracker tracker = new ExpenseTracker();  
  
    tracker.addExpense("electricitybill", 1000, "housing");  
  
    tracker.addExpense("clothes", 700, "housing");  
  
    tracker.addExpense("vegetables", 200, "Food");  
  
    tracker.addExpense("snacks", 100, "Food");  
  
    tracker.viewExpensesByCategory("Housing");  
  
    tracker.generateExpenseReport();  
  
    }  
  
}
```

Output:

```
java -cp /tmp/Hn3qAKQa0E/ExpenseTracker
```

No expenses in category: Housing

Category: housing

Description: electricitybill, Amount: 1000.0

Description: clothes, Amount: 700.0

Total for category: 1700.0

Category: Food

Description: vegetables, Amount: 200.0

Description: snacks, Amount: 100.0

Total for category: 300.0

Total expenses: 2000.0
